

Characteristics of Tablo Home Hemodialysis Users in Medicare Fee-for-Service

Stephan Dunning, MS, MBA¹; Cynthia J. D'Alessandri-Silva, MD¹; Michael Aragon, MD¹, Eric Weinhandl, MS, PhD^{2,3}

Study Overview

- Retrospective analysis of Tablo Home HD patients among the Medicare Fee-for-service population, Jan-June 2022
- N=53, unique Tablo HHD users in Medicare FFS, using the CRA TPNIES HCPCS code, E1629
- Summarized user characteristics, including age, sex, race/ethnicity, and concurrent Medicaid enrollment, as well as treatment characteristics.

Key Results

- Between Jan 1 and June 30, 2022, there were 53 patients who collectively had 1,830 billed Tablo HHD treatments
- Mean (SD) age: 60.6 (15.5), with 51% age \geq 65.
- 28.3% Black, 49.1% White and 22.6% Other
- 34.4% of users had concurrent Medicaid enrollment (aka dual-eligibility for both Medicare and Medicaid)
- Mean (SD) weight of 82.9 (20.8) kg, and a mean (SD) hemoglobin of 9.8 (1.4) g/dL.
- Vascular access type in use was 42% Catheter, 58% Fistula

Conclusion

- ✓ Novel and early window into Tablo HHD users and treatments in the Medicare FFS population
- ✓ The Tablo HHD population appears to be more elderly and diverse, and with greater catheter dependence than the broader HHD population
